

ABSTRACTION

This thesis focuses on the design of information system applications that are installed on android smartphone connected to a database stored in a hosting website. This is done because the information process is still done manually. To realize this, it will be done research methods with methods of analysis and design method in which the method of analysis, the authors analyze the needs and through the results of the analysis the authors designed stages that will be done. The purpose of this paper is to produce concrete results in providing convenience in obtaining information from Bangka Belitung Islands.

While the result is the achievement of convenience gained users, namely the public in obtaining information about the history and the regional specialties of Bangka Belitung Islands quickly and easily, which means people do not need to bother to come to the department of tourism Bangka Belitung province to find out specific information want to know. In its users, android smartphone must be connected to the internet so that the information can be accessed. The conclusion in the can is by Introducing Application Specific Foods In Regional And Local History Bangka Belitung Province Based Android, then the delivery of information to the public will be easier, faster, and effective, when compared to using the manual method.
